Stage 7 — Public Leaderboard Score Predictions

Predictions recorded before the public scores for these two submissions are known.

Model	CV IPCW C-index	Predicted public C-index
Elastic-net + XGBoost ensemble	0.7250	0.7575
XGBoost Cox alone	0.7244	0.7569

Prediction 1. Ensemble

The ensemble exceeded elastic-net Cox by 0.0032 in centre-grouped cross-validation and won all 15 paired folds. Using the known elastic-net public score of 0.7543 as an anchor: 0.7543 + 0.0032 = **0.7575**.

Prediction 2. XGBoost Cox

XGBoost exceeded elastic-net Cox by 0.0026 in centre-grouped cross-validation and won 14 of 15 paired folds. Applying the same difference: 0.7543 + 0.0026 = **0.7569**.

Expected comparison

The ensemble is predicted to exceed XGBoost by 0.7575 - 0.7569 = **0.0006**. This is a small difference and not a guarantee of the public ranking. The two supplied submission files each contain 1,193 patient risk scores; these are predictions of leaderboard performance, not scores calculated from patient outcomes.
